

etiologic treatment of radiation sickness. This paucity of knowledge despite the countless studies of radiation effects since Roentgen's observations in 1896. The relatively ineffective symptomatic approach only fuels the hysteria about the biologic effects of low levels of fallout or diagnostic radioisotopes. Thus the need for a concerted effort to establish a more informed image of nuclear effects and applications.

The psychologic fallout of Chernobyl emphasizes some issues for the Committee on Radiobiologic Effects of the Society of Nuclear Medicine and suggests that the JNM encourage submission of articles on basic and applied research into the treatment of radiation sickness.

REPLY: Dr. Hartwig is correct in describing the treatment of radiation sickness as a "symptomatic approach." This has long been practiced by radiotherapists who are the physicians most experienced in dealing with the symptoms of mild radiation sickness. Reviews of more intensive treatment including bone marrow transplants in persons who have received near-lethal exposures appear in several works including the recent revision of the Health Effects Model published by the Nuclear Regulatory Commission (1) and the book by Hübner and Fry (2). There are of course few instances of accidental exposure where such treatment has been indicated; Chernobyl being the largest to date.

Many have suggested that nuclear medicine physicians should be informed on the medical management of these rare accidents along with hematologists and radiotherapists. How-

ever, because nuclear medicine more generally concerns whole body doses that are orders of magnitude below the "radiation sickness" threshold, publication in the JNM of research on these high dose effects would clearly be of marginal interest for the practicing nuclear medicine physician in my view. Of more importance to the Society would be the continuation of the public relations effort to dispel the uninformed fear surrounding radiation doses of the order of 1 rad.

Correction: Amendment to Author Line

In the letter "Skeletal Tuberculosis Resembling Metastatic Disease on Bone Scintigraphy," (*J Nucl Med* 1987; 9: 1507-1509), James J. Smith, MD, should be included in the list of authors, following Elmo Acio.

Correction: Article Corrections by Edward A. Deutsch

In the article "Development of Nonreducible Technetium-99m(III) Cations as Myocardial Perfusion Imaging Agents: Initial Experience in Humans," (*J Nucl Med* 1987; 28:1870-1880), Luigi Zecca should appear in the author line following Fabio Columbo.

In the article "In Vivo Inorganic Chemistry of Technetium Cations," (*J Nucl Med* 1987; 28:1491-1500) the captions for Figures 4, 5, and 6 were inadvertently switched. The caption appearing as Fig. 6 belongs with Fig. 4; the caption appearing as Fig. 4 belongs with Fig. 5; the caption appearing as Fig. 5 belongs with Fig. 6.
